

OUROBOROS ROADMAP

The work has to earn its way forward.

PURPOSE

Ouroboros is building one way to turn a conversation into work that can be specified, checked, and used again. This page shows the product path, the work now under way, and the conditions that must be met before later products are opened.

CURRENT EVIDENCE

WORK IN PROGRESS

LATER, IF EARNED

01

What stays the same

The product is not a feature for one model or one app. It is the working loop that remains when the model, runtime, and channel change.

I

Clarity first

The work starts by finding what the person means. A prompt is not yet a specification.

II

A real test

A result has to meet declared criteria. Looking plausible is not a verification method.

III

Something remains

The next run should not begin from a blank page. It should inherit the useful parts of the last one.

02

The product loop

The loop is simple enough to explain and demanding enough to matter. Every stage leaves a record for the next one.

Interview

Find the intent and the missing decisions.

Seed

Write down the agreed specification.

Execute

Do the work that the specification calls for.

Evaluate

Check the result against its criteria.

Evolve

Carry the evidence into the next version.

↻ the evaluation changes the next Seed

Seed the recorded intent	Workflow the route that worked
Evaluation the evidence behind a decision	Lineage what changed, and why

03

Who it is for

The early market is defined by a work situation, not by age or job title. The common thread is that the person has context worth carrying forward and an outcome that cannot stop at a plausible draft.

I

Context to delegate

Owners and operators who already spend time or money handing work to an assistant, a colleague, or an outside specialist.

II

Work that repeats

Advisors and service providers whose replies, documents, and decisions keep taking time away from the work they are paid to do.

III

More than a demo

People who have tried many tools but still need work that survives a second pass and can be used again.

04

The work in front of us

Product proof, user proof, and distribution are different jobs. Each needs its own evidence before the next path opens.

This is the current order of work, not a launch calendar.

VALIDATION

ChatGPT desktop

The Windows candidate has an installation path and a prepared first-use route. It still needs a real first question in the ChatGPT interface.

The Apple Silicon preview exists; real-device installation, signing, notarization, and first use remain open.

- Next proof: real first use

PLANNED

Hosted entry

The hosted route is not live. Its gates are a submission agreement, an official directory submission, and first external activation.

- Next decision: public entry criteria

PROPOSED

Nondeveloper pilot

The question is whether people who do not build software can use their own material to create a useful, personal work system. The product contract and ten-person pilot are not settled.

- Next decision: official program scope

BLOCKED

Concierge pilot

Before a managed service can be judged, it needs three people, representative work, and enough time to see whether the workflow survives ordinary use.

- Next decision: first three users

Public site and conversion

The public site exists. The product-specific call to action and the path from visit to first use or pilot application still need to be connected and measured.

- Next decision: the primary CTA

05

What has evidence, and what does not

A roadmap becomes misleading when an open question is drawn like a finished product. The distinction matters more than the number of boxes on the page.

AREA	STATUS	WHAT WE KNOW	WHAT STILL HAS TO HAPPEN
Open-source core	CURRENT	The workflow and its runtime integrations are public.	Keep the core useful as runtimes change.
ChatGPT desktop	VALIDATION	Windows and Apple Silicon artifacts exist at different evidence gates.	Real user installation and first-use proof.
Nondeveloper use	PROPOSED	A consumer profile hypothesis and experiment issue exist.	A program decision, onboarding, first useful work, and reuse evidence.

AREA	STATUS	WHAT WE KNOW	WHAT STILL HAS TO HAPPEN
Cloud, enterprise, marketplace	LATER	They are candidate ways to deliver the same workflow.	Field demand, reuse, operating cost, and customer requirements.

06

How the work can travel

The later paths are delivery choices, not separate identities for the product. Each one earns its place by answering a specific user need.

Concierge

A person helps discover the intent, turns it into a working setup, and tunes it with the user. It matters first because early workflows do not yet exist on their own.

Gate

A repeatable delivery method from the first pilot.

Cloud

A managed always-on path is only useful if people need their work to continue while their own computer is off, and are willing to pay for that continuity.

Gate

Observed need for continuity and a viable operating cost.

Enterprise

The same workflow may later be delivered where data boundaries, approvals, audit records, self-hosting, or service commitments matter. That is not a vO promise.

Gate

A real customer requirement and evidence that the workflow has value.

Marketplace

A workflow can only be sold or shared when it works beyond the person whose context created it. That portability has not been proved.

Gate

Several reused workflows that transfer across users.

RUNTIME INDEPENDENCE

Ouroboros already works across multiple runtimes. ChatGPT is one public entry point. Kiro, Claude Code, Codex, Gemini, Copilot CLI and other supported environments are places where the same specification and evaluation discipline can travel. None of them define the product on their own.

07

What counts as progress

The first proof is a completed piece of work for a user. Revenue and distribution come after that. Targets follow observed baselines, not the other way around.

Completion

The specification is fully handled and the result passes its checks.

Preservation

A later run does not break what the earlier run completed.

Reuse

The next run uses the prior Seed or workflow without making the person explain the context and procedure again.

Delegated time

The amount of agreed manual work the system actually takes over.

Human intervention

Whether people are approving expected steps or rebuilding the work from scratch each time.

Operating cost

Whether runtime, support, and maintenance cost can be traced back to each workflow.

08

Reading this roadmap

1. This is a sequence of evidence, not a promise that every later product will ship on a fixed date.
 2. Cloud, enterprise, and marketplace remain candidates until the current pilots establish demand, reuse, and workable economics.
 3. Runtime names describe compatible places to run the workflow. They do not imply endorsement, sponsorship, or a commercial relationship.
 4. The core workflow is open source at
